

SNAKE LEGS & WISDOM TEETH

S.S.C.

Evolution is the scientific explanation for how all life on Earth changes over time

Some believe in "Intelligent Design" - the idea that life does not evolve, but instead was created by a divine being resulting in "perfect" design

Our DNA still carries this ancient information inside us. Evolution explains these oddities. But "Intelligent Design"?

Perhaps it's not so "intelligent" after all...

But just how "perfect" is our design? Why do creatures have so many parts with no use?... Like the nipples on boys, for example?

The hip bones of whales are also traces of their ancestors that walked.

Sometimes ancestors' traits even reappear! Like this dolphin caught in Japan with back flippers! Or, occasional human babies born with little tails ...

Labels: back limbs, Femur, Pelvis

In fact, some of these traits are not only evidence against "Intelligent Design," but also strong evidence of our evolutionary past...

-The pelvic & leg bones of some snakes, for example, are "vestigial" of ancestors that walked on all fours.

OR other things our bodies have that are not only useless but also, inconvenient.

How "wise" are wisdom teeth?

Sometimes even dangerous, like the appendix!

Labels: Pelvis, femur
